

## 2.1.2 Bookmarks study

Date updated: January 19, 2017

### Possible solution

1. A badge (using warning color SGv1.4) containing a number of new bookmarks will show up here until next bookmark list opening. Take note that a The badge will also appear on the bookmark tab . The badge on the main zone will be the total of what is new.
2. No views options in bookmarks? yes?
3. We must not show empty accordions. On hover an X icon will appear to delete the bookmark. Clicking the link will navigate the user to the page. If it is possible to hide the X so that the users will not be restricted to move around. X means delete or close having that in mind they might stop them to play around the screen having the X icons lying around until needed.
4. Deleted bookmark state using warning color. Undo link will restore the deleted bookmark immediately. It will not disappear until page load. (UX Forgiveness)
5. This concept is used on groups. This bookmark icon will be on the screen all the time. I am still half hearted about this because it very bold and distracting in my end. (I need your insights)

Default unhidden

Hovered

Bookmarked

### *Bookmark states*

Once the bookmark is checked. A modal will popout, interrupting the user to declare some infos.
